

Learning Style Quiz Results:

- Auditory: 40%
- Visual: 50%
- Tactile: 10%

I find the results interesting because I always thought I was a tactile learner. However, I realize I like tactile activities because I can visually see what is going on and can remember that when taking a test.

Learning Style Article

My Child Psych Professor talked about Learning styles and this article for a class and the conversation we had was incredibly interesting. Students may prefer a certain way of learning, however, they cannot best learn unless exposed to all three. If we look at my test results, we see that my preferred learning style is a mixed bag of all three. This means that if a teacher presented a class with only tactile learning strategies, I would struggle. As well if the primary strategy was visual. A well rounded classroom will provide opportunities to learn with all three.

This contradicts some core teaching strategies like Montessori. Where the children mostly learn through tactile setups. While this can create a unique environment in comparison to public school, the students are robbed of an equal opportunity to learn in the other two ways. This can be said for traditional common core as well. Lectures cannot give a student a full understanding of the subject. There must be a mix of all three.
